

ABSTRACT

A laundry washing machine (1) has a cabinet (2) inferiorly delimited by a respective bottom (F) in which a recess (17) is formed. The recess (17) is open towards the exterior of the cabinet (2) in two directions, substantially orthogonal to each other (X, Y). To the bottom can be fastened a lower base (20) defining a respective cavity (21), in such a way that the recess (17) of the bottom of the cabinet (2) and the cavity (21) of the base (20) directly communicate with each other, to form a seat for housing a container.
